

# Form

## Lecture 6

# What are forms?

- ▶ `<form>` is just another kind of HTML tag
- ▶ HTML forms are used to create (rather primitive) GUIs on Web pages
  - ▶ Usually the purpose is to ask the user for information
  - ▶ The information is then sent back to the server
- ▶ A **form** is an area that can contain **form elements** **is used to create a data input form.**
  - ▶ The syntax is: `<form parameters> ...form elements... </form>`
  - ▶ Form elements include: buttons, checkboxes, text fields, radio buttons, drop-down menus, etc
    - ▶ Other kinds of HTML tags can be mixed in with the form elements
  - ▶ **The FORM element has three attributes:**
    - ▶ **ACTION, METHOD, and ENCTYPE.**
  - ▶ A form usually contains a **Submit** button to send the information in the form elements to the server
  - ▶ The form's **parameters** tell JavaScript how to send the information to the server (there are two different ways it could be sent)
  - ▶ Forms can be used for other things, such as a GUI for simple programs

# Forms

## **METHOD:**

- ▶ Specifies the way in which the data from the user are encoded.
- ▶ The default METHOD is GET, although the POST method is preferred.
- ▶ GET: The CGI program receives the encoded form input in the QUERY\_STRING variable, which follows the “?” in the URL that calls the script.
- ▶ POST: The CGI script or program receives the encoded form input in its standard input stream. The CONTENT\_LENGTH must be used.

# Forms

## **ACTION:**

- ▶ Specifies the destination URL to which the form should be submitted, once it has been completed by the user.
- ▶ If no URL is specified, the URL of the current document containing the form is used.
- ▶ MAILTO Action: The data from the form is mailed to the specified E-mail address. Use the POST method.

# Forms

## **ENCTYPE:**

- ▶ Tell the browser how the data from a form should be encoded when it is returned to the server.
- ▶ The default is “application/x-www-form-urlencoded” that converts spaces to “+” and uses “&” to delineated different data fields.

# The <form> tag

- ▶ The `<form arguments> ... </form>` tag encloses form elements (and probably other HTML as well)
- ▶ The arguments to `form` tell what to do with the user input
  - ▶ `action="url"` (required)
    - ▶ Specifies where to send the data when the `Submit` button is clicked
  - ▶ `method="get"` (default)
    - ▶ Form data is sent as a URL with `?form_data` info appended to the end
    - ▶ Can be used *only* if data is all ASCII and not more than 100 characters
  - ▶ `method="post"`
    - ▶ Form data is sent in the body of the URL request
    - ▶ Cannot be bookmarked by most browsers
  - ▶ `target="target"`
    - ▶ Tells where to open the page sent as a result of the request
    - ▶ `target=_blank` means open in a new window
    - ▶ `target=_top` means use the same window

# The <input> tag

- ▶ Most, but not all, form elements use the **input** tag, with a **type="..."** argument to tell which kind of element it is
  - ▶ **type** can be **text**, **checkbox**, **radio**, **password**, **hidden**, **submit**, **reset**, **button**, **file**, or **image**
- ▶ Other common **input** tag arguments include:
  - ▶ **name**: the name of the element
  - ▶ **value**: the “value” of the element; used in different ways for different values of **type**
  - ▶ **readonly**: the value cannot be changed
  - ▶ **disabled**: the user can’t do anything with this element
  - ▶ Other arguments are defined for the **input** tag but have meaning only for certain values of **type**

# TYPE Attribute

## TEXT type:

- ▶ Specifies a single line text entry field.
- ▶ Can be used with the maxlength and size attributes (maxlength >= size)

```
<p><b> first name:</b> <input name="fname" type = text maxlength=30 size =30></p>
```

```
<p><b> last name:</b> <input name="lname" type = text maxlength=30 size =30></p>
```

## PASSWORD Type:

- ▶ Same as text except the text entered by the user is obscured.
- ▶ Use the maxlength and size attributes.

```
<p><b> enter your password:</b>
```

```
<input name="password" type = password maxlength=30 size =30></p>
```

# Text input

A text field: `<input type="text" name="textfield" value="with an initial value">`

A text field:

A multi-line text field `<textarea name="textarea" cols="24" rows="2">Hello</textarea>`

A multi-line text field

A password field: `<input type="password" name="textfield3" value="secret">`

A password field:

- Note that two of these use the `input` tag, but one uses `textarea`

# Buttons

- ▶ A submit button: `<input type="submit" name="Submit" value="Submit">`
- ▶ A reset button: `<input type="reset" name="Submit2" value="Reset">`
- ▶ A plain button: `<input type="button" name="Submit3" value="Push Me">`

A submit button: 

A reset button: 

A plain button: 

**submit:** send data

▶ **reset:** restore all form elements to their initial state

▶ **button:**

▶ Creates a button whose use can be defined through scripting and **on Click event**.

▶ Use to create a back button.

▶ Only useful to browsers that support scripting.

- Note that the type is **input**, not “button”

# Checkboxes

- ▶ A checkbox: `<input type="checkbox" name="checkbox" value="checkbox" checked>`

A checkbox: ☒

- ▶ `type: "checkbox"`
- ▶ `name`: used to reference this form element from JavaScript
- ▶ `value`: value to be returned when element is checked
- ▶ Note that there is *no text* associated with the checkbox—you have to supply text in the surrounding HTML

# Radio buttons

12

Radio buttons:<br>

```
<input type="radio" name="radiobutton" value="myValue1">male<br>
```

```
<input type="radio" name="radiobutton" value="myValue2" checked>female
```

Radio buttons:

male

female

- ▶ If two or more radio buttons have the same **name**, the user can only select one of them at a time
  - ▶ This is how you make a radio button “group”
- ▶ If you ask for the value of that **name**, you will get the **value** specified for the selected radio button
- ▶ As with checkboxes, radio buttons do not contain any text

# Drop-down menu or list

13

- ▶ A menu or list:  

```
<select name="select">  
  <option value="red">red</option>  
  <option value="green">green</option>  
  <option value="BLUE">blue</option>  
</select>
```

A menu or list:

- ▶ Additional arguments:
  - ▶ **size**: the number of items visible in the list (default is "1")
  - ▶ **multiple**: if set to "true", any number of items may be selected (default is "false")

# Hidden fields

- ▶ `<input type="hidden" name="hiddenField" value="nyah">`  
    &lt;-- right there, don't you see it?

14

A hidden field: &lt;-- right there, don't you see it?

- ▶ What good is this?
  - ▶ All **input** fields are sent back to the server, including hidden fields
  - ▶ This is a way to include information that the user doesn't need to see (or that you don't want her to see)
  - ▶ The **value** of a hidden field can be set programmatically (by JavaScript) before the form is submitted

# A complete example

15

```
<html>
<head>
<title>Get Identity</title>
<meta http-equiv="Content-Type" content="text/html;
      charset=iso-8859-1">
</head>
<body>
<p><b>Who are you?</b></p>
<form method="post" action="">
  <p>Name:
    <input type="text" name="textfield">
  </p>
  <p>Gender:
    <input type="radio" name="gender" value="m">Male
    <input type="radio" name="gender" value="f">Female</p>
</form>
</body>
</html>
```

**Who are you?**

Name:

Gender: ☐ Male ☐ Female

# TEXTAREA

- ▶ Let users enter more than one line of text.
- ▶ Uses attributes ROWS and COLS to size.
- ▶ WRAP Attribute:
  - ▶ OFF: No wrapping
  - ▶ VIRTUAL: Display wraps but long lines are sent as one line.
  - ▶ PHYSICAL: Word wraps and text is sent with wrap points.

# PullDown Menu

- ▶ Use SELECT and OPTION to create pulldown menu.
- ▶ SELECT:
  - ▶ Allows the user to choose one (or possibly more) items from a list.
  - ▶ Attributes: MULTIPLE, SIZE, and NAME.
- ▶ OPTION:
  - ▶ Specifies the list items.
  - ▶ Attributes: SELECTED, VALUE, and LABEL

# PullDown Menu

## ► Example:

<P><B>Pick your favorite baseball team:</B>

<BR><SELECT NAME="team">

<OPTION>Dodgers

<OPTION>Braves

<OPTION>Cardinals

<OPTION>Yankees

</SELECT>

# Form Programming

- ▶ Handling GET Forms:

- ▶ A typical invocation of a GET-style application might use a URL like this:

`http://www.kumquat.com/cgi-bin/dump_get?name=bob&phone=555-1212`

- ▶ When the server processes this URL, it invokes the application named `dump_get` stored in the directory named `cgi-bin`. Everything after the question mark is passed to the application as parameters.
    - ▶ The parameters are placed in a variable named `QUERY_STRING`.

# Form Programming

- ▶ Handling POST Method:
  - ▶ Data is sent in the format:  
name=bob&phone=555-1212
  - ▶ No URL is sent.
